

**Nov 1 alkanolamide-free thickening latex**

The present application relates to a novel process for water-in-oil latices, and to the application of these latices as thickeners and/or emulsifiers for skincare products and haircare products or for the manufacture of cosmetic, dermopharmaceutical or pharmaceutical preparations.

Among the various existing thickeners which are used for these purposes, there are, in particular, synthetic thickening polymers, which are in the form of inverse latices, i.e. latices in which the continuous phase is an oil. These latices dissolve extremely quickly; the polymers contained in these inverse latices are, for example, acrylamide/sodium 2-acrylamido-2-methylpropanesulfonate copolymers; they are already neutralized and when they are dissolved in water, for example to a concentration of 1%, it is observed that the pH is generally greater than 6. Such inverse latices are disclosed in the European patent applications published under Nos. EP 0 186 361 and EP 0 503 853. These latices retain considerable thickening capacity even at pH 4.

However, the process for preparing such copolymers uses surfactants of the alkanolamide family, for instance Witcamide<sup>TM</sup> 511; now, these chemical compounds are liable to degrade into compounds of the nitrosamine family which are themselves products that are known as being potentially carcinogenic. The simple implementation of the precautionary principle thus makes it unavoidable that, in the short or long term, the inverse latices mentioned above will be banned from use in the preparation of cosmetic, dermopharmaceutical or pharmaceutical products. Consequently, the Applicant has become interested in developing a novel process for synthesizing inverse latices which does not have this drawback.

One subject of the invention is a process for preparing a composition in the form of an inverse

09856903-090701

latex, comprising an oil phase, an aqueous phase, at least one emulsifier of water-in-oil (W/O) type, at least one emulsifier of oil-in-water (O/W) type and from 20% to 75% by weight, mainly from 20% to 60% by weight and more particularly from 30% to 45% by weight, of a branched or vulcanized anionic polyelectrolyte, this process successively comprising:

- a step (a) of preparing an aqueous solution containing the monomers and the optional additives;
- 10       - a step (b) of emulsifying the aqueous phase prepared in step (a), in an organic phase, in the presence of one or more emulsifiers of water-in-oil type;
- 15       - a step (c) of polymerizing the monomers in the aqueous phase, initiated by introducing a free-radical initiator into said phase; and
- 20       - a step (d) of adding one or more emulsifiers of oil-in-water type to the resulting dispersion, at a temperature of less than 50°C, characterized in that:
  - the polymerization reaction in step (c) is carried out at a pH of less than 5.5,
  - none of said emulsifiers belongs to the alkanolamide family, and
  - 25       - said anionic polyelectrolyte is based either on a monomer containing a strong acid function, or on at least one monomer containing a strong acid function copolymerized either with at least one monomer containing a weak acid function or with at least one
  - 30       neutral monomer.

According to one variant of this process, the reaction medium obtained from step (b) is concentrated by distillation before carrying out step (c).

According to one preferred embodiment of the process as defined above, the polymerization reaction is initiated with a redox couple which generates hydrogen sulfite ions ( $\text{HSO}_3^-$ ), such as the cumene hydroperoxide/sodium metabisulfite ( $\text{Na}_2\text{S}_2\text{O}_5$ ) couple, or the cumene hydroperoxide/thionyl chloride ( $\text{SOCl}_2$ )

couple, at a temperature of less than or equal to 10°C, if desired, supplemented with a polymerization cointiator such as, for example, azobis(isobutyronitrile) (AIBN), and is then carried out either  
5 virtually adiabatically up to a temperature of greater than or equal to 50°C, or by controlling the temperature.

The term "alkanolamide" denotes the products resulting from the action of fatty acids in equimolar  
10 amounts on alkanolamines such as, for example, mono- or diethanolamine.

The expression "emulsifier of the water-in-oil type" denotes emulsifiers having an HLB value which is low enough to give water-in-oil emulsions such as the  
15 surfactant polymers sold under the name Hypermer<sup>TM</sup> or such as sorbitan extracts, for instance the sorbitan monooleate sold by the company SEPPIC under the brand name Montane<sup>TM</sup> 80, or the sorbitan isostearate sold by SEPPIC under the name Montane<sup>TM</sup> 70<sup>®</sup>.

The expression "emulsifier of the oil-in-water type" denotes emulsifiers with an HLB value which is high enough to give oil-in-water emulsions such as  
20 ethoxylated sorbitan esters, for instance sorbitan oleate ethoxylated with 20 mol of ethylene oxide.

The term "branched polymer" denotes a nonlinear polymer containing pendent chains so as to obtain, when this polymer is dissolved in water, a highly entangled  
25 state leading to very high viscosities at low shear.

The term "vulcanized polymer" denotes a  
30 nonlinear polymer in the form of a three-dimensional network which is insoluble in water, but swellable in water and thus leading to the production of a chemical gel. The composition obtained according to the process as defined above may comprise vulcanized moieties  
35 and/or branched moieties.

A subject of the invention is, more particularly, a process as defined above, characterized in that 30% to 80% and preferably 30% to 60%, in molar proportions, of the monomer moieties which the anionic

09856903.090704  
T02060" E0695860

polyelectrolyte comprises contain a strong acid function; and more particularly characterized in that the anionic polyelectrolyte comprises from 30% to 50% of a monomer comprising a strong acid function and from 5 70% to 50% either of a monomer comprising a weak acid function or of a neutral monomer.

The strong acid function in the monomer comprising it is, in particular, the sulfonic acid function or the phosphonic acid function, and said 10 monomer is preferably 2-methyl-2-[(1-oxo-2-propenyl)-amino]-1-propanesulfonic acid. or the acid. The weak acid function in the monomer comprising it is, in particular, the carboxylic acid function, and said monomer is preferably chosen from acrylic acid, 15 methacrylic acid, itaconic acid and maleic acid. The neutral monomer is chosen in particular from acrylamide, 2-hydroxyethyl acrylate, 2,3-dihydroxyethyl acrylate, 2-hydroxyethyl methacrylate, 2,3-dihydroxyethyl methacrylate, or an ethoxylated derivative, with 20 an EO number of between 1 and 20, for each of these esters.

A subject of the invention is, more particularly, a process as defined above, characterized in that the anionic polyelectrolyte comprises, in molar 25 proportions, from 30% to 50% of 2-methyl-2-[(1-oxo-2-propenyl)amino]-1-propanesulfonic [lacuna], partially or totally salified in the form of an alkali metal salt, preferably the sodium salt, or in the form of the ammonium salt, and from 70% to 50% of acrylamide.

30 A subject of the invention is, more particularly, a process as defined above, characterized in that the anionic polyelectrolyte is vulcanized and/or branched with a diethylenic or polyethylenic compound in a molar proportion, expressed relative to 35 the monomers used, of from 0.005% to 1% and preferably from 0.01% to 0.1%, and the vulcanizing agent and/or branching agent is chosen in particular from ethylene glycol methacrylate, sodium diallyloxyacetate, ethylene glycol diacrylate, diallylurea, trimethylolpropane

09556903-090704  
FOZ060"E06.95860

triacrylate and, more particularly, methylene-bis(acrylamide).

The latex obtained by the process according to the invention generally contains from 2.5% to 15% by weight and preferably from 4% to 9% by weight of emulsifiers, among which from 20% to 50% and in particular from 25% to 40% of the total weight of the emulsifiers present are of the water-in-oil (W/O) type and in which from 80% to 50% and in particular from 75% to 60% of the total weight of the emulsifiers are of the oil-in-water (O/W) type.

According to one particular aspect of the process as defined above, the emulsifiers of the water-in-oil type consist essentially of sorbitan monooleate.

According to another particular aspect, the composition obtained by the process as defined above is characterized in that the oil phase represents from 15% to 40% and preferably from 20% to 25% of its total weight. This oil phase consists either of a commercial mineral oil containing saturated hydrocarbons of paraffinic, isoparaffinic or cycloparaffinic type, having at room temperature a density of between 0.7 and 0.9 and a boiling point of greater than 180°C, such as, for example, Exxsol D 100 S sold by EXXON or a white mineral oil, such as Marcol<sup>TM</sup> 52, or the isohexadecane sold by Bayer or isododecane, or of a plant oil or of a synthetic oil, or of a mixture of several of these oils.

According to one preferred aspect of the present invention, the composition obtained by the process as defined above is characterized in that the oil phase consists essentially of isohexadecane or of Marcol<sup>TM</sup> 52. Isohexadecane, which is identified in Chemical Abstracts by the RN number = 93685-80-4, is a mixture of C<sub>12</sub>, C<sub>16</sub> and C<sub>20</sub> isoparaffins containing at least 97% C<sub>16</sub> isoparaffins, among which the main constituent is 2,2,4,4,6,8,8-heptamethylnonane (RN = 4390-04-9). Marcol<sup>TM</sup> 52 is a commercial oil corresponding to the definition of liquid petroleum of

the French Codex. This is a white mineral oil in accordance with FDA regulations 21 CFR 172.878 and CFR 178.3620(a) and is registered in the US Pharmacopoeia in US XXIII (1995) and in the European pharmacopoeia (1993).

The latices contain between 20% and 50% water. The latices according to the invention may also contain various additives such as complexing agents, transfer agents or chain-limiting agents.

A subject of the invention is also the use of the composition obtained according to the process as defined above, to prepare a cosmetic, dermo-pharmaceutical or pharmaceutical topical composition.

A topical composition according to the invention, intended to be applied to human or animal skin or mucous membranes, may consist of a topical emulsion comprising at least one aqueous phase and at least one oil phase. This topical emulsion may be of the oil-in-water type. More particularly, this topical emulsion may consist of a fluid emulsion, such as a milk or a fluid gel. The oil phase of the topical emulsion may consist of a mixture of one or more oils.

A topical emulsion according to the invention may be intended for cosmetic use or may be used to prepare a medicinal product intended for treating diseases of the skin and of mucous membranes. In the latter case, the topical composition then comprises an active principle which may consist, for example, of an anti-inflammatory agent, a muscular relaxant, an anti-fungal agent or an antibacterial agent.

When the topical composition is used as a cosmetic composition intended to be applied to the skin or mucous membranes, it may or may not comprise an active principle, for example a moisturizer, a tanning agent, a sunscreen, an anti-wrinkle agent, a slimming agent, a free-radical scavenger, an antiacne agent or an antifungal agent.

A topical composition according to the invention usually comprises between 0.1% and 10% by

0955603-090701

weight of the thickener defined above. The pH of the topical composition is preferably greater than or equal to 5 and is more preferably between 6 and 12.

The topical composition may also comprise compounds conventionally included in compositions of this type, for example fragrances, preserving agents, colorants, emollients or surfactants.

According to yet another aspect, the invention relates to the use of the novel thickener in accordance with the invention mentioned above, to thicken and emulsify a topical composition comprising at least one aqueous phase.

The cosmetic, dermopharmaceutical or pharmaceutical composition defined above generally comprises from 0.1% to 10% and more particularly between 0.5% and 5% by weight of said inverse latex. It is in particular in the form of a milk, a lotion, a gel, a cream, a cream-gel, a soap, a bubble bath, a balm, a shampoo or a conditioner.

In general, said inverse latex may advantageously replace the products sold under the name Sepigel™ 305 or Sepigel™ 501 by the Applicant, in cosmetic, dermopharmaceutical or pharmaceutical compositions, since it also has good compatibility with the other excipients used for the preparation of formulations such as milks, lotions, creams, soaps, [lacuna] baths, balms, shampoos and conditioners. It may also be used in combination with said Sepigel products.

It is especially compatible with the concentrates disclosed and claimed in international publications WO 92/06778, WO 95/04592, WO 95/13863, WO 98/47610 and FR 2 734 496, or with the surfactants disclosed in WO 93/08204.

It is particularly compatible with Montanov™ 68, Montanov™ 82, Montanov™ 202 and Sepiperl™ N. It may also be used in emulsions of the type disclosed and claimed in EP 0 629 396 and in cosmetically or physiologically acceptable aqueous

095593-00701

dispersions with a polyorganosiloxane compound chosen, for example, from those disclosed in WO 93/05762 or in WO 93/21316. It may also be used to form cosmetically or physiologically acceptable aqueous gels of acidic pH, such as those disclosed in WO 93/07856; it may also be used in combination with nonionic celluloses to form, for example, styling gels, such as those disclosed in EP 0 684 024, or alternatively in combination with fatty acid esters of sugars, to form compositions for treating the hair or the skin such as those disclosed in EP 0 603 019, or alternatively in shampoos or conditioners as disclosed and claimed in WO 92/21316, or finally in combination with an anionic homopolymer such as Carbopol<sup>TM</sup> to form hair treatment products such as those disclosed in DE 195 23596. It is also compatible with many active principles such as, for example, self-tanning agents, for instance dihydroxyacetone (DHA) or antiacne agents; it may thus be introduced into self-tanning compositions such as those claimed in EP 0 715 845, EP 0 604 249, EP 0 576 188 or WO 93/07902. It is also compatible with N-acyl amino acid derivatives, which allows its use in soothing compositions in particular for sensitive skin, such as those disclosed or claimed in WO 92/21318, WO 94/27561 or WO 98/09611. It is also compatible with glycolic acids, with lactic acid, with salicylic acid, retinoids, phenoxyethanol, sugars, glyceraldehyde, xanthans, fruit acids and the various polyols used in the manufacture of cosmetic formulations.

A subject of the invention is thus also the use of an inverse latex as defined above to prepare a cosmetic, dermatopharmaceutical or pharmaceutical composition.

The examples which follow are intended to illustrate the present invention without, however, limiting it.

09355903-090701  
T02060-EP695860

**Exempl 1: Preparation of the latex according to the invention**

a) The following are loaded into a beaker, with stirring

- 5 - 80 g of deionized water,
  - 95.96 g of aqueous 48% (by weight) sodium hydroxide solution,
  - 246.7 g of 2-methyl-2-[(1-oxo-2-propenyl)amino]-1-propanesulfonic acid,
  - 10 - 253.8 g of 50% acrylamide,
  - 0.45 g of sodium diethylenetriaminepentaacetate,
  - 0.132 g of methylenebis(acrylamide);
- the pH of the aqueous phase described above is adjusted to about 5.0 and the amount of aqueous phase is made up to 682 g by adding deionized water. In parallel, an organic phase is prepared by introducing the following successively into a stirred beaker:
- 15 - 220 g of isohexadecane,
  - 21 g of Montane<sup>TM</sup> 80 VG (sorbitan oleate sold by SEPPIC)
  - 20 - 0.2 g of AIBN.

The aqueous phase is gradually introduced into the organic phase and is then subjected to vigorous mechanical stirring using an Ultra-Turrax<sup>®</sup> mixer sold by IKA.

The emulsion obtained is then transferred into a polymerization reactor. The emulsion is bubbled with a strong stream of nitrogen so as to remove the oxygen, and is cooled to about 5-6°C.

5 ml of a solution containing 0.28% (by weight) of cumene hydroperoxide in isohexadecane are then added.

After a sufficient amount of time for good homogenization of the solution, an aqueous sodium metabisulfite solution (2.5 g in 100 ml of water) is then added at a rate of 0.5 ml/minute. The addition is carried out over about 60 minutes. During this addition, the temperature in the polymerization reactor

is allowed to rise up to the final polymerization temperature.

The reaction medium is then maintained at this temperature for about 90 minutes.

5        The mixture is cooled to a temperature of about 35°C and 50 g of sorbitan oleate ethoxylated with 20 mol of ethylene oxide are added slowly.

The desired emulsion is obtained:

Evaluation of the properties

10    + viscosity in water containing 2% latex (Brookfield RVT spindle 6, speed 20): 23 450 mPa·s

(Brookfield spindle 6, speed 5):  $\eta$  = 69 000 mPa·s.

15        b) The process described above in paragraph a) is repeated, replacing the isoheaxadecane with Marcol<sup>TM</sup> 52, to prepare a latex based on white mineral oil.

The examples which follow use any one of the emulsions prepared in Example 1.

20    **Example 2: Care cream**

	Cyclomethicone:	10%
	Composition 1:	0.8%
	Montanov <sup>TM</sup> 68:	2%
	Stearyl alcohol:	1%
25	Stearic alcohol:	0.5%

B	Water:	qs 100%
	Dihydroxyacetone:	5.0%
	Monosodium phosphate:	0.2%
C	Composition 1:	0.5%
5 D	Fragrance:	0.3%
	Sepicide™ HB:	0.8%
	NaOH:	qs pH = 5

10 Montanov™ 68 (cetearyl glucoside) is a self-emulsifying composition as disclosed in WO 92/06778, sold by the company SEPPIC.

Micropearl™ M 100 is an ultrafine powder with a very soft feel and a matt effect, sold by the company Matsumo.

15 Sepicide™ CI, imidazolineurea, is a preserving agent sold by the company SEPPIC.

Pemulen™ TR is an acrylic polymer sold by Goodrich.

Simulsol™ 165 is self-emulsifying glyceryl stearate, sold by the company SEPPIC.

20 Lanol™ 1688 is a nongreasy emollient ester sold by the company SEPPIC.

Lanol™ 14M and Lanol® S are consistency factors sold by the company SEPPIC.

25 Sepicide™ HB, which is a mixture of phenoxyethanol, methyl paraben, ethyl paraben, propyl paraben and butyl paraben, is a preserving agent sold by the company SEPPIC.

Monteine™ CA is a moisturizer sold by the company SEPPIC.

30 Schercemol™ OP is a nongreasy emollient ester.

Lanol™ P is a stabilizing additive sold by the company SEPPIC.

Parsol™ MCX is octyl para-methoxycinnamate, sold by the company Givaudan.

35 Sepiperl™ N is a nacreous agent sold by the company SEPPIC, based on a mixture of alkylpolyglucosides such as those disclosed in WO 95/13863.

0095903 00700

Micropearl<sup>TM</sup> SQL is a mixture of microparticles containing squalane which is released by the action of massaging; it is sold by the company Matsumo.

5 Lanol<sup>TM</sup> 99 is isononyl isononanoate, sold by the company SEPPIC.

Lanol<sup>TM</sup> 37T is glyceryl triheptanoate, sold by the company SEPPIC.

Solagum<sup>TM</sup> L is a carrageenan sold by the company SEPPIC.

10 Marcol<sup>TM</sup> 82 is a liquid paraffin sold by the company Esso.

Lanol<sup>TM</sup> 84D is dioctyl malate, sold by the company SEPPIC.

Parsol Nox<sup>TM</sup> is a sunscreen sold by the company Givaudan.

15 Eusolex<sup>TM</sup> 4360 is a sunscreen sold by the company Merck.  
Dow Corning<sup>TM</sup> 245 fluid is cyclomethicone, sold by the company Dow Corning.

Lipacide<sup>TM</sup> PVB is a palmitoylated wheat protein hydrolyzate, sold by the company SEPPIC.

20 Micropearl<sup>TM</sup> LM is a mixture of squalane, poly(methyl methacrylate) and menthol, sold by the company SEPPIC.

Sepicontrol<sup>TM</sup> A5 is a mixture of capryloylglycine, sarcosine and extract of Cinnamon zylanicum, sold by the company SEPPIC, such as those disclosed in the  
25 international patent application PCT/FR98/01313 filed on 23 June 1998.

Capigel<sup>TM</sup> 98 is an acrylate copolymer sold by the company SEPPIC.

30 Lanol<sup>TM</sup> 2681 is a mixture of caprylate and coconut caprylate, sold by the company SEPPIC.

Montanov<sup>TM</sup> 202 is a composition as disclosed in WO 98/47610, sold by the company SEPPIC.
